

## Free the writing permission on Windows 7...

If you cannot set the VisualWorks Home directory (equivalent of the Java *classPath*), from `C:/vw7.6nc/cormas` to `→ C:/vw7.6nc/`, this is due to Windows 7 that prevents to modify some registry entries. It is therefore necessary to login on Windows as **Super Administrator**.

### Adding a Super-Administrator account

In the prompt command, type CMD, **without** pressing the Enter key!

In the top menu, right-click on cmd.exe then select: « Run as administrator »

Then in the window, type: **net user Administrator /active :yes**

(for other languages, type: **net user Administrateur /active :yes** for Windows in french or **net user Administrador /active :yes** (in Portuguese), or ...)

```
Administrateur: C:\Windows\System32\cmd.exe
Microsoft Windows [version 6.1.7601]
Copyright (c) 2009 Microsoft Corporation. Tous droits réservés.

C:\Windows\system32>net user Administrator /active:yes
Le nom d'utilisateur est introuvable.

Vous obtiendrez une aide supplémentaire en entrant NET HELPMSG 2221.

C:\Windows\system32>net user Administrateur /active:yes
La commande s'est terminée correctement.

C:\Windows\system32>
```

It is necessary that "the command completed successfully."

### Set the environment variable for VisualWorks

To set the new value of the Environment Variable definitively, it is necessary to login as Super User (just once).

First, log off Windows and log in by clicking on "Administrator":

(If this is the first time, Windows will configure the desktop, that may take a little time.)

Once you are logged in as Administrator, find the file `cormas.im` (Normally the Administrator account does not know how to open it). Then select (right button) « open with... » and select:  
`C:/vw7.6nc/bin/win/visual.exe`

In the main interface of VW, click on the 3th "Settings" button , then on tab called "System". Click on the "Paste Current" button and remove 'cormas' from the path that is proposed. Apply. You should now have this:

From now on, your VW Environment variable is set properly. You can leave the Administrator session and return to your normal session: the VisualWorks environment variable will be ok for the next exciting years of modeling!

Simple, isn't it??!
